

WaveImage Modal

MEASUREMENT, ANALYSIS AND MONITORING OF STRUCTURE- AND AIR-BORNE SOUND

Software WaveImage:
Determining the natural vibration of an aircraft model

WaveImage Modal is a software that allows determining vibrational properties via known **Experimental (EMA)** and **Operational Modal Analysis (OMA)** methods. The software features a unique combination of modal analysis algorithms.

Furthermore, WaveImage Modal features **Operating Deflection Shapes Analysis (ODS)**, which is used to calculate vibrational properties under actual operating conditions.

To analyse rotational structures, WaveImage Modal offers algorithms for **Order Analysis (OA)**. Order analysis is the analysis of noise or vibrations of rotating structures. In contrast to frequency analysis, the energy content of sound is not plotted against frequency but against the order. The order is a multiple of the speed.

In addition to data-based modal analysis, WaveImage Modal offers a **Finite Element Analysis (FEA)** component for simulating vibrational properties based on structural

geometry and material properties. To adjust the FE model to measured data-based modal results (through OMA and EMA) a **Structural Dynamics Modification (SDM)** is also available.

Measurement data for dynamic structure analysis can be recorded by means of acceleration, speed and displacement transducers and processed using WaveImage Modal.

BENEFITS

- ✓ Full solution from simulation, measurement, analysis to report
- ✓ Intuitive graphical user interface to ensure easy handling
- ✓ Fast upload and analysis of large files with several thousand measurement points

WaveImage Modal

MODULE

Experimental Modal Analysis (EMA)

Component for structures with measurable and targeted excitation (artificial excitation via WaveImage possible)

Finite Element Analysis (FEA)

Component for FE simulation of vibrational properties on the basis of structural geometry and material properties

Export

Formate:

VIB, UFF (with Export Component), STL

Operational Modal Analysis (OMA)

Component for structures with stochastic or ambient excitation, where a measurable excitation is complicated or impossible

Geometry

Component for creating and / or processing geometries and for assigning sensors

Convert

Component for converting time data

Report

Component for automated report generation

Operating Deflection Shapes (ODS)

Component for calculating vibrational properties under operating conditions

Signal Viewer

Component for the visualization of sensor data (incl. Preprocessing component for signal processing)

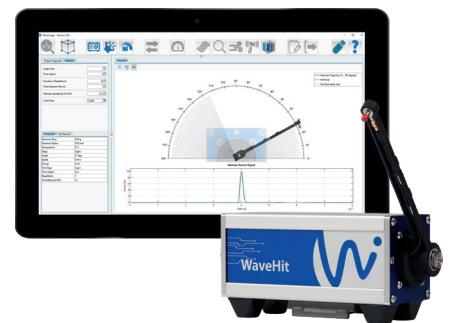

Order Analysis, Filtering and Tracking (OA)

Component for the analysis of rotating structures with constant or variable speed. Displays information on harmonic oscillations which can not be detected by the standard modal analysis algorithms due to speed changes during the measurement (e.g. motors, pumps).

Recorder

Interactive, complete measurement software for fast acquisition, saving and display of vibro-acoustic sensor data

WaveHit

Component for automatic detection and connection with the electronic WaveHit Modal Hammer
